Data connection with Gauddi

From simple calendar CSV's, complete factory planning spreadsheets to Cinema API's; we have connected it all. History has shown that the biggest bottleneck for completing a data connection project is usually the lack of a detailed described deliverable and getting the necessary information from the client.

1. Please describe what the end result will be ?

Example: We schedule meetings in different rooms in our Software X System and want to show it on our screens. On the screen on the ground floor we want to show an overview of all meetings. The screens next to the meeting room doors will show today's coming meetings in that room.

2. Does the data provider allow us to use the data ?

Example: Yes, I've contacted Person Y of Software X System and they confirmed the possibilities.

3. How can we get the file(s) or data ?

Example. Software X System will place the file at the following location:
<http://www.client.com/softwareXsystem/meetings.json>

4. Please provide an example of the data. A data file usually has a .json, .xml or .csv extension. Sometimes it is a so-called endpoint of an API this is a web address (=url)

Example: meetings.json or http://www.softwarexsystem/API/getMeetings?id=client)
